PC and NO-PC version wheel aligners: Removal of DVDs/CDs from Wheel Aligners and New Software Access Procedure 

The continuous technological evolution of computer systems and the increasing need for flexibility have rendered DVD and CD optical drives obsolete, replacing them with more modern solutions such as network-based systems and cloud platforms. This transition provides significant advantages in terms of convenience, security and latest updates always available. In line with this trend, the computers used in CCD wheel aligners - just as already implemented for laptops and rugged tablets of the mobile CCD versions - are no longer equipped with DVD players.

► **What will change?**

Starting with the January 2026 production cycle, installation DVDs and CDs will no longer be supplied in wheel-aligner standard equipment (such as PC- NO pc and full pack versions).

They will be replaced by an information brochure containing a link to the INFOAUTO portal, from which the most up-to-date version of the software can be securely downloaded

Link: www.teco.it/infoauto

► **Retrofit Kit and Backward Compatibility**

Retrofit kits (for database and/or additional functions) will continue to include both a DVD and a USB key including the same version of the program, to ensure full compatibility with all aligners, even the older ones.

► **No operational impact**

The wheel aligner PCs will continue to be supplied already configured with the latest available version of the software, with no change in operational procedures. The aim is to streamline management, reduce the use of now-obsolete physical media and ensure rapid, secure and always accessible updates.
